

IV FLUIDS AND PUMPS
UPDATED: JULY 2007

FORMER QA POLICY

Certain nuclear medicine procedures require the administration of IV medications prior to or during the scan. In these cases the patient's own IV fluids/pump will be stopped by the nuclear medicine physician or technologist so as not to interfere with the scan. The IV/pump will be turned back on by the nuclear medicine physician or technologist, and the amount of time the IV was off will be indicated by a note attached to the front of the patient's chart.
