

PERITONEAL SHUNT
UPDATED: APRIL 2010

FORMER QA POLICY

Indications: One of the imaging indications listed in the protocol should be present.

Pre-Procedure: Determine the patient has a shunt present and whether it is a LAVEEN or DENVER type. The DENVER shunt requires pumping after injection of tracer. The NM physician performing the procedure should ensure that the patient does understand the procedure.

Procedure Note:

1. Date and time of procedure
2. Site of intraperitoneal entry and radiopharmaceutical administered
3. Presence or absence of discomfort
4. Condition of patient at end of procedure
5. Name (legible) of clinician performing procedure
6. Any specimen taken
7. Any complications noted
8. No nursing requirements
